

**Allotment Assessment and Evaluation Report for
New Mexico Standards and Guidelines for Public Land Health
Canon de la Mina (#888) – October 14, 2010**

Permittee/Lessee		<u>Authorization Number</u> 3001564		
Livestock Use	Preference AUMs	<u>Allotment</u> 00888	<u>Active</u> 12	<u>Suspended</u> 0
	Period of Use / Kind of livestock	<u>Allotment</u> Canon de la Mina	<u>Number/Kind</u> 1 Cattle	<u>Season of Use</u> 03/01 – 02/28
	Percent Public Land	AUMs are authorized at 100% public land		
Allotment Profile	Physical Description	<p>Allotment 888 is located approximately 4.25 miles east of Villanueva in San Miguel county, New Mexico. Canon de la Mina allotment lies 0.3 miles west of the Pecos River. The allotment is made up of low hills with pinyon-juniper and an understory of perennial warm season grasses. The elevation ranges from 5700 to 5800 feet.</p> <p>Three soil types are identified within the BLM parcels. Soils within the parcels are:</p> <p>LR - Laporte-Rock outcrop complex, steep. These soils consist of channery loams, with rooting depths between 10 to 20 inches. Parent materials of alluvium and colluvium derived dominantly from sandstone and limestone comprise these soils. Average annual precipitation ranges between 16 and 20 inches. Hazards for erosion are slight to moderate. Vegetation is characterized by pinyon, juniper, blue grama, oak, sideoats grama, and little bluestem.</p> <p>TR - Tuloso-Rock outcrop-Sombordoro association, steep. These soils consist of stony sandy and stony loams with rooting depths ranging from 8 to 20 inches. Parent materials are primarily derived from sandstone. Average annual precipitation is about 16 inches. Hazards for erosion are slight to moderate. Vegetation is characterized by pinyon, juniper, blue grama, hairy grama, sideoats grama, little bluestem and pinyon ricegrass.</p> <p>TS - Tuloso-Sombordoro-Rock outcrop complex moderately sloping. These soils consist of stony sandy and stony loams with rooting depths ranging from 8 to 20 inches. Parent materials are primarily derived from sandstone. Average annual precipitation is about 16 inches. Hazards for erosion are slight to moderate. Vegetation is characterized by pinyon, juniper, blue grama, hairy grama, sideoats grama, and pinyon ricegrass.</p>		
	Land Status Acreage	<u>BLM</u> 65	<u>State</u> 0	<u>Private</u> 0

	Management Objectives	The allotment is under a ‘Custodial’ (‘C’) management category. ‘C’ category allotments have evidence of a “not apparent” to “upward” long term trend, have no significant resource conflicts and have a low potential for improvement in vegetative production.		
	Key Forage Species	little bluestem, pinyon ricegrass, sideoats grama, blue grama, hairy grama		
	Grazing System	Year round use		
Current Conditions / Management	Actual Use	Actual use reports were not submitted. Use was determined by billed AUMs.		
	Utilization	Due to the lack of staff, utilization studies have not been conducted. During the assessment visit it was determined that the allotment was receiving slight to moderate utilization.		
	Climate	<p>The past water year (Oct. 1, 2009 – Sept. 30, 2010) the average temperature has been slightly below average (0 to 1 degrees Fahrenheit below average) and precipitation below average (0 to 3 inches below average). The winter was slightly wetter (0 to 1.5 inches above normal) and was colder (3 to 4 degrees Fahrenheit below average). The spring was drier (0 to 0.75 inches below normal) and was colder (0 to 1 degrees Fahrenheit above average). This should provide below average plant growth for cool season plants. The summer precipitation was below average (0 to 1.5 below normal) and slightly warmer (1 to 2 above normal) which should provide below normal growth for warm season plants.</p> <p>Global climate change resulting from increasing atmospheric CO₂ levels may accelerate rates of plant extinction and result in shifts in ecosystem structure (species diversity) and function. We anticipate that our monitoring efforts will track vegetation shifts allowing for management modifications to address local range impacts resulting from global climate change.</p>		
	Trend	In 2010 monitoring transects and photo points were placed in the allotment to establish vegetation trend. The full findings are kept in the allotment file at the Taos Field Office, but are summarized below.		
		<table><tr><td>Plot #1</td><td>2010</td></tr></table>	Plot #1	2010
Plot #1	2010			

			Ground Cover	(%)	
			Bare Ground	58	
			criptogams	0	
			gravel	14	
			rock	0	
			litter	10	
			MUTO	4	
			BOHI	5	
			PLJA	1	
			JUMO	1	
			BOGR	7	
			Species Composition		(%)
			BOHI	20	
			MUTO	24	
			PLJA	11	
			BOGR	35	
			BOER	2	
			JUMO	4	
			CHMA	2	
			BOCU	2	
	Riparian	There is no riparian area within the allotment.			
	Wildlife	Seasonal home ranges in the allotment include those for deer, elk, bear, bobcat, fox, coyote, small mammals and reptiles, bats, raptors, turkey vulture, songbirds, and a variety of insects. Some dietary overlap occurs between wildlife and cattle; however, best management practices would ensure that forage production within this area can support both wildlife and livestock on a sustained basis.			
	Threatened and Endangered Species	It is determined that there are no federally listed threatened or endangered species likely to be found in the subject allotment. There is no designated critical habitat for any species listed by the USFWS within the allotment. Special status species that are likely to be found on the allotment (seasonally) include bald eagle and ferruginous hawk.			
Findings / Rationale for the New Mexico Standards for Public Land Health		A Rangeland Health Evaluation Matrix was completed on October 14, 2010. This evaluation matrix is from Technical Reference 1734-6 “Interpreting Indicators of Rangeland Health.” The actual matrix forms are available within the allotment file. Below is a summation of the information gathered by the on site evaluation. Within the Rangeland Health Attributes are three different categories of indicators. The categories include; Soil and Site Stability, Hydrologic Function and Biotic Integrity. The percent of indicator score			

		<p>was created by multiplying an assigned value for departure from site descriptions/reference areas by the number of indicators at the level. Departure scores are categorized as: none to slight = 5, slight to moderate = 4, moderate = 3, moderate to extreme = 2 and extreme = 1. For example, if all indicators under Soil/Site Stability were rated none to slight (best condition), the equation would be $5(\text{score}) * 10(\text{indicators}) = 50 / 50 * 100 = 100\%$ similarity, or what is expected based on an Ecological Site Description.</p> <p>Soil and Site Stability Two indicators were deemed None to Slight, seven were deemed Slight to Moderate, one was deemed Moderate, zero were deemed Moderate to Extreme, and zero were deemed Extreme to Total. Rating: 82%</p> <p>Hydrologic Function One indicator was deemed None to Slight, seven were deemed Slight to Moderate, two were deemed Moderate, zero were deemed Moderate to Extreme, and zero were deemed Extreme to Total. Rating: 78%</p> <p>Biotic Integrity Four indicators were deemed None to Slight, four were deemed Slight to Moderate, one was deemed Moderate, zero were deemed Moderate to Extreme, and zero were deemed Extreme to Total. Rating: 87%</p> <p>Overall Rating: 82%</p>
	Upland Standard	<p><i>Upland ecological sites are in productive and sustainable condition within the capability of the site. Upland soils are stabilized and exhibit infiltration and permeability rates that are appropriate for the soil type, climate, and landform. The kind, amount and/or pattern of vegetation provides protection on a given site to minimize erosion and assist in meeting State and Tribal water quality standards.</i></p> <p>This allotment is meeting the Upland Standard based on the above evaluation and information. Rills and pedestals are present, but not active. Water-flow patterns nearly match what is expected. Soil surface is somewhat resistant to erosion, but some soil loss has occurred. Bare ground is higher than expected for the site (58% of ground cover) and litter is moving with surface water flow from intense rainstorms; however, soil loss appears minimal.</p>
	Biotic Communities Standard	<p><i>Ecological processes such as hydrologic cycle, nutrient cycle, and energy flow support productive and diverse native biotic communities, including special status, threatened, and endangered species appropriate to site and species.</i></p>

		<p>This allotment is meeting the Biotic Communities Standard based on the above evaluation and information. Generally, vegetation and wildlife species are as expected for the site. Juniper trees are encroaching into open areas in the allotment. The study site has a good mix of grass species with grasses occupying 17% of ground cover. Litter amount is lower than expected. Although ground cover is high, annual production is less than other sites with similar characteristics.</p>
	Riparian Standard	<p><i>Riparian areas are in a productive, properly functioning and sustainable condition, within the capability of that site.</i></p> <p>The Riparian Standard does not apply to this allotment. No riparian areas are present.</p>
Conclusion		<p>The New Mexico Standards for public land health are being met; therefore no Determination Document is warranted. Continued monitoring will help establish future trend. It is recommended that the grazing lease be renewed for the next ten years without any changes.</p>

Consultation and Coordination

This Assessment and Evaluation Report has been sent or given to the affected permittee(s) / lessee(s), the interested publics and the following interdisciplinary team members for input and review:

Merril Dicks – Archeologist
 Scott Draney – Department of Game and Fish
 Greg Gustina – Fish Biologist
 Pam Herrera-Olivas – Wildlife Biologist
 Tami Torres – Outdoor Recreation Planner
 Jacob Young – Rangeland Management Specialist
 Paul Williams – Archeologist
 Valerie Williams – Wildlife Biologist

This document was prepared by: Derek Trauntvein – Rangeland Management Specialist
